

A
Report on
**THE FACTORS AFFECTING THE USE OF FINTECH IN
BANKING**

Submitted for the partial fulfillment of the degree Bachelor
of Business Administration (Hons)

Submitted by
Keyur Pathar
BM21BBBA157
Finance Specialization

Under the guidance of
Dr. Payal Saxena

Submitted to
Sarvajanik Education Society
B. R. C. M. College of Business Administration
Sarvajanik University Surat

2023-24

CERTIFICATE

This is to certify that Mr. Pathar Keyur Rajubhai of T.Y.B.B.A. VIth Semester (Finance Specialization) Roll No. 52 and Enrollment No. BM21BBA157 has undergone Project Training work for two months during the semester.

His Project entitled “Factors Affecting The use of Fintech In banking” has been found satisfactory.

Signature of the Project Guide

Signature of Head of the Institute

Date:

ACKNOWLEDGMENT

This research project is a bridge connecting education and professional use. It is the path leading to success by shouldering responsibilities under the careful guidance of seniors and experienced personnel without fear and failure.

It gives me immense pleasure to take the opportunity to remember and thank the personalities who were involved with this project work during its study stage during my days of hard work. I feel that I must express thanks and deep gratitude to everyone who is directly or indirectly associated with the completion of this dissertation report.

In preparation for this project, I had to take the help and guidance of respected madam Dr. Payal Saxena, who is Finance faculty at B.R.C.M. College of Business Administration, and he deserves my deepest gratitude. As the completion of this project gave me much pleasure, I would like to express my gratitude to the B.R.C.M. College of Business Administration, the Trust of the College, Principal Sir Dr Jayesh Desai, SARVAJANIK UNIVERSITY, and the guide of this research, Dr. Payal Saxena, who gave me opportunities to do this project. Without her, this research could not have been fulfilled.

Date:

Keyur Pathar

DECLARATION

I hereby declare that the project titled “THE FACTORS AFFECTING THE USE OF FINTECH IN BANKING” is a bonafide work duly completed by me. No part of the report is plagiarized from other sources. It does not contain any part of the project or thesis submitted by any other candidate to this or any other institute or university. All information included from other sources have been duly acknowledged. I aver that if any part of the report is found to be plagiarized, I shall take full responsibility for it.

Place: SURAT

Executive Summary

The research report delves into the realm of financial technology (fintech) and its impact on the banking sector. Fintech encompasses the use of technology to provide financial services and products to consumers in innovative ways, such as digital wallets, mobile payments, and peer-to-peer lending. The primary objectives of the study are to analyze fintech adoption rates across different demographic groups, evaluate the accessibility of fintech from users' perspectives, and identify crucial areas for enhancing accessibility and adoption.

The research design employed in the study is descriptive research, with a sample size of 200 respondents. Both primary and secondary data were collected through a combination of online and offline survey methods, targeting both fintech and non-fintech banking customers. The literature review section provides an in-depth analysis of existing research on fintech adoption drivers, opportunities, and challenges in various geographical locations and industries. Key studies explore factors such as regulations, security concerns, and customer behaviors that influence fintech usage, highlighting gaps in understanding the full impacts of fintech and optimal strategies for traditional banks.

Data analysis tools, including frequency tables, cross-tabulation, chi-square tests, and ANOVA, were utilized to analyze the relationships between various variables. The study examined demographic profiles, familiarity with fintech, usage patterns, and satisfaction levels. Factors significantly impacting fintech accessibility, as reported by respondents, include personalized settings, physical barriers, and screen readers. The study also found that mobile technology and apps play a significant role in boosting accessibility, as indicated by the majority of respondents. Additionally, the study revealed that gender, education, and age influence familiarity and usage of fintech services.

The study provides valuable insights into the adoption and accessibility of fintech in the banking sector. However, it also highlights the need for further research, particularly in understanding the dynamics of rural markets and optimizing the benefits of digital banking for customers.

Table of Contents

Chapter – 1: Introduction	1

Chapter – 1: Introduction

1.1 Brief History of FinTech:

While fintech seems like a recent series of technological breakthroughs, the basic concept has existed for some time. **Early credit cards in the 1950s** generally represent the first fintech products available to the public, in that they eliminated the need for consumers to carry physical currency in their day-to-day lives. Yet, the official use of technology in financial services can be traced back to 1967 when Barclays bank installed the first ATM. This marked the real shift from technology to digital technology. From there, fintech evolved to include bank mainframes and online stock trading services. In 1998, PayPal was founded, representing one of the first fintech companies to operate primarily on the internet — a breakthrough that has been further revolutionized by mobile technology, social media, and data encryption. This fintech revolution has led to the mobile payment apps, blockchain networks, and social media-housed payment options we regularly use today.

If we talk about the banking industry, finTech is no longer jargon. Instead, it has become a familiar term in technology. Global investments in FinTech topped \$210 billion in 2021. This stat is more than evidence to prove that the digital revolution is at the doorstep of the financial services or banking sector.

The digital revolution created a huge impact on all banks and financial institutions globally. But what exactly is FinTech?

1.2 What is FinTech?

The term FinTech or Financial Technology is derived from two words: financial services and digital technology. In simple words, FinTech is the innovative use of technology in the formation and delivery of financial services.

FinTech encourages the use of digital technology in startups so that they can come up with innovative products and services, such as mobile payments, alternative finance, online banking, big data, Robo advisors, peer-to-peer lending, crowdfunding, and overall financial management.

FinTech was introduced as a back-end system technology for financial institutions and banks. However, since then, its definition has changed significantly. Today it

encompasses several consumer-based applications which can help you trade stocks, manage funds, and pay for your insurance and food via this technology.

FinTech for banking has impacted myriad applications and transformed the way of assessing finances for customers. Its impact ranges from mobile payment apps like Square to investment and insurance companies. This profound impact of FinTech can also be seen as a potential threat to brick-and-mortar or traditional banks.

Additionally, in today's digital era, customers are not keen to go for services provided by traditional banking systems. Instead, they prefer services that are quick and safe. Due to this, FinTech is gaining popularity and is disrupting the banking industry.

1.3 The Statistics about FinTech:

- According to a study by Fortune, in 2021, a vast majority of Americans (90 percent) used FinTech for managing their finances. A study also says that by 2021, there were 10,000+ fintech startups registered in the United States alone and over 26,000 globally.
- Currently, there are approx 2 billion people worldwide without bank accounts or formal financial services. FinTech came as a savior for all those people by providing an easy option to participate in and access financial services.

Also, FinTech is the best option for boosting financial inclusion as it's developed to provide consumers direct access to their finances through simple yet cutting-edge technology.

Moreover, Fintechs and banking services are interlinked with each other. Fintech can integrate banking services with its advanced innovations, making them more accessible and useful for the general population.

1.4 Why Fintech and Banks Should Work Collaboratively

Now that we are clear about what fintech is and the stats that make it an essential aspect of banking, we must understand why fintech and banks should work together:

- Increase in the use of smartphones

A study says that there were around 7.26 billion smartphone users as of 2022. This statistic is enough to interpret that there is a significant increase in the use of smartphones in the modern world.

So, all these users are potential customers of both banks and fintech. But, banks could not reach every location owing to operating costs. Here's where fintech helps banks to reach and acquire more customers.

- Almost every service is available online

Today, people can buy anything and everything online. Be it the products like medicines and groceries or the services like cleaning and grooming, everything can be found and bought online.

For banking services, fintech's payment solutions are linked with the respective bank account of the user, and then the user can use the funds in the bank to make online payments for services available on the fintech app, such as ticket booking, bill payments, EMI, and many more.

- Security is the priority

Fintech companies are utilizing advanced technologies to protect customers' financial information. They use AI for fraud detection, blockchain for secure data storage, RegTech for compliance, and multi-cloud and IoT for smarter security solutions.

These measures ensure that customers' financial information is safe from threats like fraud and hacking. Fintech companies are taking a holistic approach to security by implementing a range of technologies and solutions to keep customers' data safe and secure.

- Better Branding

Fintech companies are utilizing modern tools such as gamification to make financial tasks, such as budgeting, more engaging for customers. This refreshing approach to branding legacy services is something that banks should take note of, as it can help them attract and retain customers.

By incorporating these modern techniques, banks can improve their customer experience and stay competitive in the market.

- **Enhanced Customer Satisfaction**

Fintech companies have disrupted the financial services industry with their innovative approach to customer experience. They have a reputation for being faster, more efficient, and more secure than traditional banks, while also having lower costs. This has led to many fintech companies earning the trust of their customers through exceptional service and referral-based client acquisition.

Banks can leverage this by taking a cue from fintech and focusing on improving their own customer experience. This can lead to better service for customers, and ultimately, increased trust and loyalty to the bank. In short, Banks can improve their services by adopting the customer-centric approach of fintechs.

1.5 How FinTech is Changing the Banking and Financial Industry:

- **E-Wallets**

E-wallet is one of the top fintech solutions in the financial industry. The immense growth of E-wallets is an indicator of the rise of FinTech services. The Fisglobal Report indicates that e-wallets remain a preferred payment method among global e-commerce consumers, registering 44.5% of global e-commerce transaction volume by 2020, an increase of 6.5% from 2019. By 2024, digital wallets are projected to represent 51.7% of e-commerce payment volumes.

While Samsung Pay, PayPal, and Apple Pay are some of the well-known e-wallet companies in the world, these wallets are used for a plethora of purposes, namely P2P payments, utility bills, top-ups, ticket booking, international remittances, and many more.

In addition, there are also some standalone wallets, such as Starbucks and Walmart Pay. E-wallets have attracted users due to their tempting offerings like exciting offers, lucrative cashbacks, reward points, and many more.

E-wallets are positively impacting the banking industry by being the major source of digital payments as the users need to add their bank account

details to the wallet for adding funds to it. Also, e-wallets have increased the number of users making digital payments, ultimately benefiting the banks.

- **Smart Chip Technology**

According to Thales Group, as of 2020, there were around 10.81 billion EMV cards. Smart chip technology, also known as EMV (Europay, Mastercard, Visa) technology, is a type of chip-based payment system that uses microprocessor chips to secure payment transactions. These chips are embedded in credit and debit cards and are designed to make it more difficult for fraudulent transactions to occur.

One of the most noticeable impacts of smart chip technology on the banking industry is that it has increased the security of payment transactions. These chips create unique codes for each transaction, which makes it difficult for fraudsters to use stolen card data to make unauthorized purchases.

Hence, there has been a significant reduction in card fraud and has increased consumer confidence in electronic payments.

Additionally, smart chip technology has also made it easier for banks to comply with Payment Card Industry (PCI) security standards, which require banks to take steps to protect cardholder data. This has reduced the risk of data breaches and the associated costs for banks.

- **Biometric Sensors**

FinTech in the banking industry has given birth to many innovations, and biometric sensors are one of them. Almost all the top fintech predictions and trends have mentions of this innovation. Biometric sensors, along with Iris scanners, are two technological advancements that ATMs are witnessing.

According to ABI Research, the number of biometric sensor cards is estimated to reach up to 20.6 million by 2025. These advancements are path-breaking since they eliminate the need to carry a plastic card and there's no need to remember the PINs. This offers immense convenience and ease to the customers.

Apart from providing convenience and ease, these advancements also make ATMs more secure than ever since the user can access their account without any password. The biometric ATMs use integrated mobile applications,

fingerprint sensors, palm scans, and eye recognition to identify the account owner.

For more accurate and secure identification, ATMs also use micro-veins which eliminates the errors made by ATMs in customer recognition.

The biometric technology brings a huge sigh of relief to all the customers who panic at the thought of losing their ATM card. With biometrics, they can access their funds even if their card gets lost. Thus, there is a significant impact of biometric technology in the banking sector.

- **Mobile Banking**

The increase in the use of smartphones has compelled banks to come up with mobile applications that offer convenient FinTech banking services. The use of these applications is called mobile banking. According to a study by Allied Market Research, the global mobile banking market is expected to reach around US Dollars 1824.7 million by 2026.

Today, most banks have a mobile banking application that has a user-friendly interface and delivers almost every service available in traditional banks. They have also introduced a feature of fingerprint recognition for users. The application performs this function without any biometric app or hardware.

A mobile banking app provides quick access to funds, and the user can perform several banking functions such as quick bill payments, check deposits, account balances, statements, and many more.

- **Artificial intelligence**

Over the years, AI has become essential in FinTech banking services. According to Business Wire, the global AI in the banking market is estimated to reach \$ 64.03 billion by 2030, up from \$ 3.88 billion in 2020, with a CAGR of 32.6% during the forecast period. And AI combined with machine learning is vital for fraud detection. Banks use software for fraud detection that generates alerts whenever there is a potentially fraudulent transaction. Later it is backed up by the human investigation that determines if the attack was real or false.

However, with time the detection of attacks is becoming difficult since the attacks are becoming more sophisticated as the day passes. So, the old

method is only costly and time-consuming. Moreover, the risk of customer data loss is always there. To combat this issue, banks are now adopting AI technology. Moreover, with AI and machine learning algorithms, banks can leverage historical data to predict and determine fraud attack patterns. This will reduce half of the manual effort. And the increasing use of AI and ML in financial services can also help banks in automating their processes and get detailed insights for making informed decisions.

- AI-powered service chatbots

FinTech providers have also come up with AI-based customer service chatbots that have become popular in the recent past. According to a study by Juniper Research, it was found that the service conversations by chatbots were expected to deliver around \$8 billion worth of cost savings by the end of 2022. Chatbots are nothing but software that uses machine learning and natural language processing to impersonate human conversation, either by voice or text communication.

Chatbots can be used to deliver fast and efficient customer service, responding to frequently asked questions and helping with simple tasks such as account balance inquiries and bill payments.

Chatbots can handle a high volume of customer inquiries simultaneously, freeing up human employees to focus on more complex tasks. It can also provide personalized guidance and help, leading to a more positive customer experience.

Hence, chatbots have become an integral asset for all banks as it reduces costs, enhance customer satisfaction, and allow their agents in the call centers to focus on value addition.

1.6 How safe is FinTech?

FinTech companies are generally trusted by consumers - according to Forbes, 68% of people are willing to use financial tools developed by non-traditional (e.g., non-financial, non-banking) institutions. However, many fintech applications are relatively new, and they're currently not subject to the same safety regulations as banks. This doesn't mean that consumers shouldn't trust fintech companies with their money - it just means that being careful can be beneficial. For most consumers, the benefits of working with a fintech company outweigh the perceived risks.

Top Reasons Consumers Use FinTech

Consumer adopters turn to someone other than their main first bank

Consumers would consider a non-financial services company for financial services

Consumer adopters are willing to share their bank data with other organizations

EY, "Global FinTech Adoption Index 2019" (2019)

Chapter – 2: Literature Review

1. **(A. Dhanalakshmi1, 2022)**, In their study explores that how people's views on digital payment methods influence their decision to use FinTech services, focusing on factors like age, gender, and location. It aims to understand why some demographic groups are more inclined to adopt digital payments than others. The research highlights that while urban and semi-urban areas see higher FinTech usage due to better internet access and familiarity with technology, rural areas lag behind due to issues like connectivity, affordability of smartphones, and lack of technological literacy. However, the study's methodology, including the snowball sampling technique via social media, might limit the generalizability of the findings, and there's a gap in understanding the specific challenges faced by different demographic groups in adopting FinTech services, especially in rural areas.
2. **(Rhanoui, 2022)**, Research studies that the rise of Fintech, driven by factors like the 2008 financial crisis, the emergence of new services, and its impact on traditional banking operations, has been accelerated by the COVID-19 pandemic. This study aims to understand Fintech's substance, the services it offers, and the factors influencing customer trust and satisfaction. By surveying individuals based on demographics and financial habits, the research reveals that factors like security, familiarity with Fintech tools like ATMs, and education levels significantly affect trust and satisfaction levels. However, aspects like time savings and cost minimization show lower scores, suggesting a gap between customer expectations and the perceived benefits of Fintech services. Research in this area could further explore how to bridge this gap and enhance customer experiences in the Fintech industry.
3. **(M Yadav)**, research shows that the emergence of Fintech lending in India presents both opportunities and challenges for the financial sector. While Fintech firms offer innovative solutions that can improve access to credit, challenges exist from various perspectives. Government regulations need to be robust to ensure consumer protection and prevent unethical practices, but navigating these regulations can be complex for both Fintech firms and traditional financial institutions. Financial players face hurdles such as digital knowledge gaps, cybersecurity threats, and the cost of integrating new

technologies. Additionally, borrowers encounter issues like the digital divide and concerns about data privacy. Despite the potential benefits, these challenges highlight the need for further research to explore how Fintech lending can effectively address the financial needs of all stakeholders while mitigating risks and ensuring regulatory compliance.

4. **(P. Krishna Priya)**, this shows india's Fintech landscape presents a promising yet challenging environment, driven by a large population with significant unmet financial needs. The study aims to address gaps in existing literature by exploring the functions and adoption of Fintech among digitally active consumers. Motivators for Fintech adoption include ease of account setup, access to a variety of products, and attractive rates, while barriers include lack of awareness, trust issues, and preference for traditional financial services. Despite India's advancement in Fintech adoption, challenges persist, including regulatory hurdles, infrastructure limitations, and the conservative mindset of users and merchants. Additionally, Fintech firms face difficulties in gaining investor trust and government support. The research highlights the emergence of numerous Fintech startups across various financial segments in India but emphasizes the need for further investigation into strategies to overcome barriers and maximize the potential of Fintech in addressing the country's financial inclusion goals.
5. **(Vineet Chouhan, 2023)**, this study investigates how financial technology (Fintech) impacts traditional banking in India through customer perspectives. Fintech, known for its disruptive innovations, is reshaping the banking landscape globally. However, its specific effects on conventional banks remain underexplored. By surveying 300 bank customers, the study aims to identify whether Fintech adoption by banks brings short- or long-term benefits or challenges. It also explores whether traditional banks should collaborate with Fintech firms or compete with them. The research employs regression analysis to analyze the data, revealing that banks may need to adopt a monitoring role post-Fintech implementation. While Fintech offers opportunities for market efficiency and financial inclusion, regulatory concerns and monitoring challenges persist. The study's focus on Indian

banking and customer perceptions provides valuable insights, but gaps remain in understanding the full extent of Fintech's impact and the best strategies for traditional banks to navigate this digital disruption. Further research could delve into regulatory frameworks and collaborative strategies to address these gaps and optimize the benefits of Fintech for both banks and customers.

6. **(Anifa, 2022)** explores the impact of fintech on the financial service industry, particularly in financing and payments. The rise of banking apps and fintech innovations has transformed traditional banking, making it more accessible and efficient for customers. Following the 2008 financial crisis, the limitations of traditional banking systems became apparent, leading to a surge in fintech companies offering innovative solutions. However, while fintech has improved performance and customer experience, there are gaps in understanding its full potential and the significance of regulatory frameworks in fostering innovation. This review highlights the need for further research in niche segments of fintech, suggesting that there is still ample room for development and exploration. By analyzing fintech innovations in financing and payments, along with the role of regulatory frameworks, this review aims to shed light on key factors shaping the future of financial services.
7. **(Shubham Rajpal, 2022)** explores the impact of financial technology (FinTech) on the Indian economy, focusing on its key segments such as financing, payments, asset management, and neo-banking. FinTech, driven by technological advancements, has revolutionized traditional banking by offering innovative financial services and products. The review highlights the significant growth and investment in the Indian FinTech sector, particularly in payments, digital lending, wealth management, insuretech, and neo-banking. However, there are gaps in understanding the full potential of FinTech and its future implications, as well as the need for further research to explore regulatory frameworks, consumer behavior, and the scalability of FinTech solutions. The study emphasizes the importance of FinTech in driving financial inclusion, economic growth, and innovation in India, while also

suggesting avenues for future research to address existing gaps and challenges in the FinTech landscape.

8. **(Devi, 2022)** explores how FinTech and blockchain technologies are reshaping the banking and finance sector. It highlights how these technologies enable faster, more secure, and cost-effective transactions, reducing the need for third-party interventions. The review discusses the competition and collaboration dynamics between FinTech companies and traditional banks, emphasizing the need for banks to adapt to digital transformations to remain competitive. However, it points out challenges such as resistance to standardization among financial institutions and the necessity for robust technology infrastructure and security. A significant research gap identified is the need for further exploration into the practical implementation of blockchain and FinTech solutions in banking and finance, particularly in addressing coordination challenges and ensuring system stability.
9. **(Rani, 2021)** The literature review delves into the evolution of financial technology (FinTech) in Malaysia, tracing its roots from the introduction of credit cards to the current era of mobile banking and digital payments. Factors such as regulatory changes, technological advancements, and shifting customer expectations are identified as key drivers of FinTech growth. The review highlights the importance of factors like customer satisfaction, adoption, and security in the success of FinTech initiatives, with various models like SERVQUAL and TAM used to measure these aspects. However, a significant research gap exists in the area of security, where limited exploration has been conducted, and stakeholders' follow-up on security recommendations is lacking. This gap underscores the need for further research to address security concerns and enhance consumer confidence in FinTech solutions, thereby supporting the continuous evolution of the FinTech landscape in Malaysia.
10. **(Aggarwal, 2023)** investigates the rise of digital banking in India, highlighting its significance in modernizing the country's financial services sector. Digital banking, facilitated by electronic means like online platforms and mobile apps, offers customers unprecedented convenience and accessibility.

However, challenges such as low digital literacy, slow transformation in traditional banking practices, and a cash-dependent economy hinder its widespread adoption. Additionally, regulatory standards, customer preferences for traditional branches, and upcoming modern challenges like integrating artificial intelligence pose obstacles to digital banking's full potential. While the review outlines various innovations in digital banking services such as digital KYC, APIs, chatbots, biometrics, cloud banking, blockchain, and fintech companies, there's a notable gap in understanding how these innovations can address the existing challenges and accelerate digital banking adoption in India. Further research is needed to explore strategies for overcoming barriers and maximizing the benefits of digital banking for the Indian population, particularly in rural and underserved areas.

Chapter – 3: Research Methodology

3.1 Rationale of the Study:

This research is about factors affecting the fintech and banking is important because it helps us understand how technology is changing the way we bank. Fintech combines finance and technology, making banking easier and more efficient. This study looks at how many people are using fintech, how easy it is for them to access it, and if they're happy with it. Learning about these things helps predict future trends in banking.

3.2 Research Objectives:

Primary objectives:

- To assess the level of customer satisfaction with existing fintech solutions in the banking sector.
- To analyse the adoption rate of fintech services among different demographic segments.
- To evaluate the accessibility of fintech from the user perspective.

Secondary objectives:

- To study demographics and other attributes affecting fintech adoption and usage
- To identify areas important for the accessibility and adoption of fintech from the customer's point of view.

3.3 Research Design:

Type:

The chosen research design for this study was descriptive research.

Scope of the study:

The study aims to investigate the factors influencing the adoption of fintech in banking, with a focus on adoption rate, accessibility, and customer satisfaction. The research will target banking customers who utilize fintech services and those who do not, across different demographic segments.

3.4 Population:

The population for this study comprises banking customers.

3.5 Sampling:

3.5.1 Sampling Frame:

The sampling frame consists of customers of various banks. This includes both traditional banks offering fintech solutions and purely digital banks.

3.5.2 Sampling method:

Convenience sampling was used to gather responses from the Population and Snowball Sampling was used.

3.5.3 Sample size:

The entire set of items under study was referred to as the sample size. A sample size of 200 was estimated here.

3.6 Data collection:

3.6.1 Instrument used for data collection:

For primary data collection, a structured questionnaire was designed to measure variables related to fintech adoption, accessibility, and customer satisfaction. The questionnaire included Multiple choice question, checkbox, likert scale and matrix question to capture quantitative data.

3.6.2 Data collection procedure:

The survey was conducted both online and through face-to-face interviews. Online google form was distributed through email and social media platforms, while face-to-face interviews was conducted by going to every respondent.

3.7 Data Analysis

3.7.1 Tools for representing data:

Tables, graphs, charts, and percentages

3.7.2 Data Analysis Tools:

SPSS & MS excel was used to analyse the data collected through google form online and offline. To analyse the data descriptive analysis such as frequencies, cross-tabulations and chart analysis were performed. For hypothesis testing, chi-square, independent T-test and ANOVA were performed.

3.8 Limitations of Study

Small Sample Size: The research was constrained by a relatively small sample size, which may limit the generalizability of findings to a larger population. The outcomes might not accurately represent the diverse perspectives of clients of banks.

Limited Scope: The study may not cover all aspects of fintech adoption, accessibility, and customer satisfaction, leading to gaps in understanding the broader landscape of fintech banking services.

Sampling Bias: The use of convenience sampling may introduce bias as the sample may not be fully representative of the entire population of fintech banking customers.

Chapter – 4: Data Interpretation & Analysis

4.1 Frequency

4.1.1 Gender:

Statistics		
Gender		
N	Valid	200
	Missing	0

Table 1: Frequency of Gender

Gender					
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Male	122	61	61	61
	Female	78	39	39	100
	Total	200	100	100	

Figure 1: Fequency of gender

Interpretation:

The table shows the frequency of valid and missing responses by gender. There are a total of 200 respondents, and all of them are valid. There are no missing values.

Here is a breakdown of the table by gender:

Male: There are 122 respondents, which is 61% of the total.

Female: There are 78 respondents, which is 39% of the total.

Overall, the table shows the frequency of respondents between males and females.

4.1.2 Age Group:

Statistics		
Age group		
N	Valid	200
	Missing	0

Table 2: Frequency of Age group

Age Group					
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	18-24	95	47.5	47.5	47.5
	25-34	50	25	25	72.5
	35-44	42	21	21	93.5
	45-54	11	5.5	5.5	99
	54+	2	1	1	100
	Total	200	100	100	

Figure 2: Frequency of Age group

Interpretation:

The table shows that there are a total of 200 respondents and all of them are valid. There are no missing values.

- **Age group 18-24:** There are 95 responses in this age group which is the highest number of responses.

- **Age group 25-34:** There are 50 responses in this age group and this is the second highest number of responses.
- **Age group 35-44:** There are 42 responses in this age group.
- **Age group 45-54:** There are 11 responses in this age group.
- **Age group 54+:** There are 2 responses in this age group.

4.1.3 Education

Statistics		
Education		
N	Valid	200
	Missing	0

Table 3: Frequency of Education

Education					
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	No formal education	4	2	2	2
	Primary education	28	14	14	16
	Secondary education	53	26.5	26.5	42.5
	Undergraduate degree	81	40.5	40.5	83
	Postgraduate degree	34	17	17	100
	Total	200	100	100	

Figure 3: Frequency of Education

Interpretation: The table shows the distribution of educational attainment in a sample of 200 people. Here's a short summary of the table:

- 2% of the people have no formal education
- 14% of the people have primary education
- 26.5% of the people have secondary education
- 40.5% of the people have an undergraduate degree
- 17% of the people have a postgraduate degree

4.2 Cross Tabulation

4.2.1 Gender and Factors encouraging to use fintech

Case Summary						
	Cases					
	Valid		Missing		Total	
	N	Percent	N	Percent	N	Percent
Gender and Factors encouraging to use fintech	178	89.00%	22	11.00%	200	100.00%

Table 4: Cross tabulation of Gender and Factors encouraging to use fintech

Crosstabulation								
			Encouraging factors to use fintech					Total
			Increased convenience and accessibility	Lower fees and charges	Personalized financial solutions and advice	Innovative and user-friendly technology	Improved security and data protection	
Gender	Male	Count	62	58	46	51	28	111
	Female	Count	38	32	30	25	22	67
Total		Count	100	90	76	76	50	178

Interpretation: The table shows the number of respondents who identified with each gender and the factors that encouraged them to use fintech.

Here are some observations from the table:

Overall: Increased convenience and accessibility seems to be the most popular factor for both genders, followed by lower fees and charges.

Men vs Women: A slightly higher percentage of males reported all factors except for improved security and data protection as encouraging them to use fintech compared to females.

4.2.2 Age group and Factors encouraging to use fintech

Table 5: Cross tabulation of Age group and Factors encouraging to use fintech

Crosstabulation								
			Encouraging factors to use fintech					Total
			Increased convenience and accessibility	Lower fees and charges	Personalized financial solutions and advice	Innovative and user-friendly technology	Improved security and data protection	
Age group	18-24	Count	53	43	36	45	27	88
	25-34	Count	25	21	16	19	16	43
	35-44	Count	18	22	19	8	6	39
	45-54	Count	3	3	4	4	1	7
	54+	Count	1	1	1	0	0	1
Total		Count	100	90	76	76	50	178

Interpretation: The table shows a cross-tabulation of factors encouraging people to use fintech and age group. It shows the number of people in each age group who responded that a particular factor was encouraging them to use fintech.

Increased convenience and accessibility is the most popular factor across all age groups, with the highest numbers in the 18-24 and 25-34 groups.

Personalized financial solutions and advice is the second most popular factor for all age groups except the 45-54 and 54+ groups, where lower fees and charges is the second most popular.

Innovative and user-friendly technology is the least popular factor for all age groups.

Overall, the table suggests that convenience and accessibility are the most important factors for people of all ages who use fintech. However, other factors, such as personalized financial advice and lower fees, are also important for some users.

4.2.3 Education and Factors encouraging to use fintech

Table 6: Cross tabulation Education and Factors encouraging to use fintech

Crosstabulation								
			Encouraging factors to use fintech					
			Increased convenience and accessibility	Lower fees and charges	Personalized financial solutions and advice	Innovative and user-friendly technology	Improved security and data protection	Total
Education	No formal education	Count	1	2	2	0	0	3
	Primary education	Count	14	14	12	9	4	26
	Secondary education	Count	21	26	20	12	10	46
	Undergraduate degree	Count	46	38	27	37	23	74
	Postgraduate degree	Count	18	10	15	18	13	29
Total		Count	100	90	76	76	50	178

Interpretation: The table shows a cross-tabulation of factors encouraging people to use fintech and level of education. It shows the number of people in each education level who responded that a particular factor was encouraging them to use fintech.

Increased convenience and accessibility is the most popular factor across all education levels, with the number of responses generally increasing with the level of education.

Lower fees and charges is the least popular factor for all education levels except for those with a postgraduate degree, where it is the second most popular factor.

People with no formal education or only primary education are less likely to say that personalized financial solutions and advice or innovative and user-friendly technology are encouraging them to use fintech compared to people with higher levels of education.

4.2.4 Gender and Significantly impact accessibility of using fintech

Case Summary						
	Cases					
	Valid		Missing		Total	
	N	Percent	N	Percent	N	Percent
Gender and Significantly impact accessibility of using fintech	199	99.50%	1	0.50%	200	100.00%

Table 7: Cross tabulation of Gender and Significantly impact sustainability

			Significantly impact accessibility of us					Total
			Screen reader compatibility	Keyboard navigation and shortcuts	Adjustable font size and color contrast	Availability of personalized accessibility settings	Physical accessibility barriers at bank branches	
Gender	Male	Count	32	38	36	63	45	121
	Female	Count	29	25	26	29	37	78
Total		Count	61	63	62	92	82	199

Interpretation: The table shows a cross-tabulation of gender and factors that significantly impact the accessibility of using fintech in banking. It shows the number of respondents who identified with each gender and reported facing a particular barrier when using fintech for banking.

From the above table we can see that the factors that are most impacting the accessibility of using fintech are physical accessibility barriers at bank branches and availability of personalized accessibility settings.

- A higher percentage of females reported facing all accessibility barriers compared to males.
 - This suggests that fewer females may find fintech accessible for banking tasks compared to males.
- Physical accessibility barriers were reported by a higher percentage of respondents overall compared to all other factors.

4.2.5 Age group and significantly impact accessibility of using fintech

Table 8: Cross tabulation of Age group and significantly impact accessibility of using fintech

Crosstabulation								
			Significantly impact accessibility of us					Total
			Screen reader compatibility	Keyboard navigation and shortcuts	Adjustable font size and color contrast	Availability of personalized accessibility settings	Physical accessibility barriers at bank branches	
Age group	18-24	Count	27	28	27	52	37	95
	25-34	Count	22	20	14	20	20	49
	35-44	Count	11	12	16	16	19	42
	45-54	Count	1	2	4	3	6	11
	54+	Count	0	1	1	1	0	2
Total		Count	61	63	62	92	82	199

Interpretation: The table shows a cross-tabulation of factors impact the accessibility of fintech and age groups. It shows the number of people in each age group who responded that a particular factor was impacting them to access fintech.

Availability of personalized accessibility settings is the most marked factors by the age group of 18-24 and second most marked by the age group of 25-34, 35-44 and 54+. Physical accessibility barriers at bank branches is the most marked factors by the age groups of 35-44 and 45-54 and second most marked by the age group of 18-24, and 25-34.

Screen reader compatibility, Keyboard navigation and shortcuts and Adjustable font size and color contrast are almost equally marked by the all age groups. From this cross tabulation we can say that almost all age groups think that availability of personalized accessibility settings and Physical accessibility barriers at bank branches both are impacting them to access the fintech services of bank.

4.2.6 Education and significantly impact accessibility of using fintech

Table 9: Cross tabulation with Education and significantly impact accessibility of using fintech

Crosstabulation								
			Significantly impact accessibility of us					Total
			Screen reader compatibility	Keyboard navigation and shortcuts	Adjustable font size and color contrast	Availability of personalized accessibility settings	Physical accessibility barriers at bank branches	
Education	No formal education	Count	2	1	1	1	2	4
	Primary education	Count	9	10	8	6	16	28
	Secondary education	Count	16	15	21	20	25	53
	Undergraduate degree	Count	26	26	26	44	27	81
	Postgraduate degree	Count	8	11	6	21	12	33
Total		Count	61	63	62	92	82	199

Interpretation: The table shows a cross-tabulation of factors that significantly impact the accessibility of using fintech in banking and Education level. It shows the number

of respondents in each education level who reported facing a particular barrier when using fintech for banking.

From above table we can see that most people with higher level of education(Secondary, undergraduate and post graduate) believe that availability of personalized accessibility settings impacts the most to the accessibility of fintech in banking which is followed by Physical accessibility barriers at bank branches.

We can also see that most people with Lower level of education (Primary and secondary) believe that Physical accessibility barriers at bank branches impacts the most to the accessibility of fintech in banking which is followed by Keyboard navigation and shortcuts, Screen reader compatibility and others.

4.3 Chi Square test

4.3.1 Gender and Familiarity with fintech

H₀: There is no association between gender and familiarity with fintech term

H₁: There is an association between gender and familiarity with fintech term.

Familiarity with fintech							Total
			I'm not familiar with it at all.	I've heard it but I'm not sure what it means.	I have a general understanding of what it means.	I'm well-versed in fintech and its different applications.	
Gender	Male	Count	17	30	47	28	122
		% within Gender	13.90%	24.60%	38.50%	23.00%	100.00%
		% within Familiar with fintech	48.60%	62.50%	62.70%	66.70%	61.00%
	Female	Count	18	18	28	14	78
		% within Gender	23.10%	23.10%	35.90%	17.90%	100.00%
		% within Familiar with fintech	51.40%	37.50%	37.30%	33.30%	39.00%
Total		Count	35	48	75	42	200
		% within Gender	17.50%	24.00%	37.50%	21.00%	100.00%

The factors affecting the use of fintech in banking

	% within Familiar with fintech	100.00%	100.00%	100.00%	100.00%	100.00%
--	--------------------------------	---------	---------	---------	---------	---------

Table 10: Chi square of Gender and Familiarity of fintech

Chi-Square Tests

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	2.972 ^a	3	.396
Likelihood Ratio	2.924	3	.403
Linear-by-Linear Association	2.232	1	.135
N of Valid Cases	200		

Interpretation: The table shows the results of a chi-square test for association between gender and familiarity with fintech. The chi-square statistic is 2.9728, with 3 degrees of freedom (df) and a significance level (asymptomatic significance (2-sided)) of 0.396.

Here, p value is 0.396. Since the p-value (.396) is greater than the significance level (usually 0.05), we fail to reject the null hypothesis (H₀). So we can say that there is no association between gender and familiarity with fintech term.

4.3.2 Age group and Familiarity with fintech

H₀: There is no association between different age group and familiarity with fintech term.

H₁: There is an association between different age group and familiarity with fintech term.

Crosstab							
			Familiarity with fintech				Total
			I'm not familiar with it at all.	I've heard it but I'm not sure what it means.	I have a general understanding of what it means.	I'm well-versed in fintech and its different applications.

Table 14: Chi square with Age group and Used mobile banking apps
Chi-Square Tests

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	22.959 ^a	4	0
Likelihood Ratio	17.995	4	0.001
Linear-by-Linear Association	12.112	1	0.001
N of Valid Cases	200		

Interpretation: The table shows the results of a chi-square test for association between age group and ever used any mobile banking applications or not. This test

statistic measures the degree of association between age group and ever used any mobile banking applications using the Pearson chi-square method.

Here, p value is 0.000. Since the p-value (0.000) is less than the significance level (usually 0.05), we reject the null hypothesis (H_0). So, we can say that there is an association between different age group and ever used any mobile banking applications or not.

4.3.6 Education and Used mobile banking apps

H_0 : There is no association between different education level and ever used any mobile banking application or not.

H_1 : There is an association between different education level and ever used any mobile banking application or not.

Pearson Chi-Square	20.684 ^a	12	0.055
Likelihood Ratio	18.649	12	0.097
Linear-by-Linear Association	0.703	1	0.402
N of Valid Cases	200		

Interpretation: The table shows the results of a chi-square test for association between age group and thinking of people that mobile technology and smartphone penetration enhance the accessibility of fintech banking services. This test statistic measures the degree of association between different age group and thinking of people that mobile technology and smartphone penetration enhance the accessibility of fintech banking services using the Pearson chi-square method.

Here, p value is 0.055. Since the p-value (0.055) is greater than the significance level (usually 0.05), we fail to reject the null hypothesis (H₀). So, we can say that there is no association between different age group and thinking of people that mobile technology and smartphone penetration enhance the accessibility of fintech banking services.

4.3.15 Education and Impact of mobile technology on fintech accessibility

H₀: There is no association between different education and thinking of people that mobile technology and smartphone penetration enhance the accessibility of fintech banking services.

H₁: There is an association between different education and thinking of people that mobile technology and smartphone penetration enhance the accessibility of fintech banking services.

Crosstab							
			Impact of mobile technology on fintech accessibility				Total

Table 24: Chi square Education and Impact of mobile technology on fintech accessibility

Chi-Square Tests			
	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	13.978 ^a	12	0.302
Likelihood Ratio	12.373	12	0.416
Linear-by-Linear Association	0.749	1	0.387
N of Valid Cases	200		

Interpretation: The table shows the results of a chi-square test for association between different education level and thinking of people that mobile technology and smartphone penetration enhance the accessibility of fintech banking services. This test statistic measures the degree of association between different education level and thinking of people that mobile technology and smartphone penetration

enhance the accessibility of fintech banking services using the Pearson chi-square method.

Here, p value is 0.302. Since the p-value (0.302) is greater than the significance level (usually 0.05), we fail to reject the null hypothesis (H_0). So, we can say that there is no association between different education level and thinking of people that mobile technology and smartphone penetration enhance the accessibility of fintech banking services.

4.4 Independent T-test

4.4.1 Gender and Trust in fintech security

H_0 : There is no significant difference in trust level that fintech companies to handle their financial data securely and responsibly between male and female.

H_1 : There is a significant difference in trust level that fintech companies to handle their financial data securely and responsibly between male and female.

Group Statistics				
Gender	N	Mean	Std. Deviation	Std. Error Mean
Trust in fintech security Male	122	3.43	1.098	.099
Female	78	3.00	1.093	.124

Table 25: Independent T-test with Gender and Trust in fintech security

Independent Samples Test										
Gender- Trust in fintech security										
		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
Trust in fintech security	Equal variances assumed	0.72	0.397	2.683	198	0.008	0.426	0.159	0.113	0.74
	Equal variances not assumed			2.685	164.742	0.008	0.426	0.159	0.113	0.74

Interpretation: The table shows that male have a higher trust level (mean = 3.43) than female (mean = 3.00) with a p-value of 0.008, which is less than the commonly used threshold of 0.05 for statistical significance and we reject the null hypothesis (H₀). So, we can say that there is a statistically significant difference in trust level between genders on how fintech companies handle financial data securely and responsibly.

4.4.2 Gender and Improvement in banking experience due to fintech adoption

H₀: There is no significant difference in improvement in banking experience due to fintech adoption between male and female.

H₁: There is a significant difference in improvement in banking experience due to fintech adoption between male and female.

Group Statistics

	Gender	N	Mean	Std. Deviation	Std. Error Mean
Improvement due to fintech adoption	Male	122	3.82	1.143	.103
	Female	78	3.76	1.186	.134

Table 26: Gender and Improvement in banking experience due to fintech adoption

Independent Samples Test										
Gender - Improvement due to fintech adoption										
		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
Improvement due to fintech adoption	Equal variances assumed	0.187	0.666	0.376	198	0.707	0.063	0.168	-0.268	0.395
	Equal variances not assumed			0.373	159.699	0.71	0.063	0.17	-0.272	0.398

Interpretation: The p-value is 0.707 which is greater than 0.05, the threshold for statistical significance. So, we fail to reject the null hypothesis (H₀). That means There is no significant difference in improvement in banking experience due to fintech adoption between male and female.

4.4.3 Gender and Satisfaction with fintech services range and variety of financial services

H₀: There is no significant difference in satisfaction with the range and variety of financial services offered by the fintech platforms between male and female.

H₁: There is a significant difference in satisfaction with the range and variety of financial services offered by the fintech platforms between male and female.

Group Statistics				
Gender	N	Mean	Std. Deviation	Std. Error Mean
Satisfaction with fintech Male	122	3.70	.924	.084
services range and variety Female	78	3.62	.996	.113

Table 27: Independent T-test Gender and Satisfaction with fintech services range and variety of financial services

Independent Samples Test										
Gender - Satisfaction with fintech services range and variety										
		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
Satisfaction with fintech services range and variety	Equal variances assumed	0.857	0.356	0.648	198	0.518	0.09	0.138	-0.183	0.362
	Equal variances not assumed			0.637	155.138	0.525	0.09	0.14	-0.188	0.367

Interpretation: From the above table we can see that the p-value is 0.518 which is greater than 0.05, the threshold for statistical significance. So, we fail to reject the null hypothesis (H₀). That means there is no significant difference in satisfaction with the range and variety of financial services offered by the fintech platforms between male and female.

4.4.4 Gender and Overall satisfaction with using fintech services

H₀: There is no significant difference in overall satisfaction with using fintech services between male and female.

H₁: There is significant difference in overall satisfaction with using fintech services between male and female.

Group Statistics					
Gender		N	Mean	Std. Deviation	Std. Error Mean
Overall satisfaction with using fintech services	Male	122	3.75	1.031	.093
	Female	78	3.59	1.167	.132

Table 28: Independent T-test Gender and Overall satisfaction with using fintech services

Independent Samples Test										
Gender - Overall satisfaction with using fintech services										
		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
Overall satisfaction with using fintech services	Equal variances assumed	4.036	0.046	1.044	198	0.298	0.164	0.157	-0.146	0.475
	Equal variances not assumed			1.016	149.353	0.311	0.164	0.162	-0.155	0.484

Interpretation: From the above table we can see that the p-value is 0.298 which is greater than 0.05, the threshold for statistical significance. So, we fail to reject the null hypothesis (H_0). That means there is no significant difference in overall satisfaction with using fintech services between male and female.

4.5 ANOVA

4.5.1 Age group and Likely to use fintech services by recommendation

H_0 : There is no significant difference in using fintech services by recommendation among age groups.

H_1 : There is a significant difference in using fintech services by recommendation among age groups.

Table 29: ANOVA with Age group and Likely to use fintech services by recommendation

ANOVA					
Age group - likely to use fintech services by recommendation					
	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	6.576	4	1.644	1.335	0.258
Within Groups	240.219	195	1.232		
Total	246.795	199			

Interpretation: In this case, the p-value (0.258) is greater than 0.05. Therefore, we fail to reject the null hypothesis. There is not enough evidence to conclude that there is significant difference between the age groups in likelihood of using fintech services by recommendation.

4.5.2 Age group and Trust in fintech services

H_0 : There is no significant difference in trust level that fintech companies to handle their financial data securely and responsibly among different age groups.

H_1 : There is significant difference in trust level that fintech companies to handle their financial data securely and responsibly among different age groups.

Table 30: ANOVA with Age group and Trust in fintech services

ANOVA					
Age group - Trust in fintech services					
	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	5.548	4	1.387	1.123	0.347
Within Groups	240.932	195	1.236		
Total	246.48	199			

Interpretation: In this case, the p-value 0.347 is greater than 0.05. Therefore, we fail to reject the null hypothesis. There is not enough evidence to conclude that there is significant difference between different age groups in trust level that fintech companies to handle their financial data securely and responsibly.

4.5.3 Age group and Improvement due to fintech adoption

H₀: There is no significant difference in improvement in banking experience due to fintech adoption among different age groups.

H₁: There is significant difference in improvement in banking experience due to fintech adoption among different age groups.

Table 31: ANOVA with Age group and Improvement due to fintech adoption

ANOVA					
Age group - Improvement due to fintech adoption					
	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	10.666	4	2.666	2.032	0.091
Within Groups	255.929	195	1.312		
Total	266.595	199			

Interpretation: In this case, the p-value 0.091 is greater than 0.05. Therefore, we fail to reject the null hypothesis. There is not enough evidence to conclude that there is significant difference in improvement in banking experience due to fintech adoption between different age groups.

4.5.4 Age group and Speed and efficiency of transactions

H₀: There is no significant difference in satisfaction with speed and efficiency of fintech services among different age groups.

H₁: There is significant difference in satisfaction with speed and efficiency of fintech services among different age groups.

Table 32: Age group and Speed and efficiency of transactions

ANOVA					
Age group - Speed and efficiency of transactions					
	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	3.852	4	0.963	0.532	0.712
Within Groups	352.628	195	1.808		
Total	356.48	199			

Interpretation: In this case, the p-value 0.712 is greater than 0.05. Therefore, we fail to reject the null hypothesis. There is not enough evidence to conclude that there is significant difference in satisfaction with speed and efficiency of fintech services among different age groups.

4.5.5 Age group and Transparency and clarity of fees and charges

H₀: There is no significant difference in satisfaction with transparency and clarity of fees and charges of fintech services among different age groups.

H₁: There is significant difference in satisfaction with transparency and clarity of fees and charges of fintech services among age different groups.

Table 33: ANOVA with Age group and Transparency and clarity of fees and charges

ANOVA					
Age group - Transparency and clarity of fees and charges					
	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	6.389	4	1.597	1.13	0.344
Within Groups	275.611	195	1.413		
Total	282	199			

Interpretation: In this case, the p-value 0.344 is greater than 0.05. Therefore, we fail to reject the null hypothesis. There is not enough evidence to conclude that there is significant difference in satisfaction with transparency and clarity of fees and charges of fintech services among different age groups.

4.5.6 Age group and Personalization and customization options

H₀: There is no significant difference in satisfaction with Personalization and customization options of fintech services among different age groups.

H₁: There is significant difference in satisfaction with Personalization and customization options of fintech services among different age groups.

Table 34: ANOVA with Age group and Personalization and customization options

ANOVA					
Age group - Personalization and customization options					
	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	3.355	4	0.839	0.65	0.627
Within Groups	251.52	195	1.29		
Total	254.875	199			

Interpretation: In this case, the p-value 0.627 is greater than 0.05. Therefore, we fail to reject the null hypothesis. There is not enough evidence to conclude that there is significant difference in satisfaction with Personalization and customization options of fintech services among different age groups.

4.5.7 Age group and Educational resources and financial literacy tools

H₀: There is no significant difference in satisfaction with Educational resources and financial literacy tools of fintech services among different age groups.

H₁: There is significant difference in satisfaction with Educational resources and financial literacy tools of fintech services among different age groups.

Table 35: ANOVA with Age group and Educational resources and financial literacy tools

ANOVA					
Age group - Educational resources and financial literacy tools					
	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	15.125	4	3.781	2.732	0.364
Within Groups	269.87	195	1.384		
Total	284.995	199			

Interpretation: In this case, the p-value 0.364 which is greater than 0.05. Therefore, we fail to reject the null hypothesis. There is no enough evidence to conclude that there is significant difference in satisfaction with educational resources and financial literacy tools of fintech services among education level.

4.5.8 Age group with Integration with other financial accounts and services

H₀: There is no significant difference in satisfaction with Integration with other financial accounts and services of fintech among different age group.

H₁: There is significant difference in satisfaction with Integration with other financial accounts and services of fintech among different age group.

Table 36: ANOVA with Age group with Integration with other financial accounts and services

ANOVA					
Age group - Integration with other financial accounts and services					
	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	11.827	4	2.957	2.049	0.089
Within Groups	281.453	195	1.443		
Total	293.28	199			

Interpretation: In this case, the p-value 0.089 is greater than 0.05. Therefore, we fail to reject the null hypothesis. There is not enough evidence to conclude that there is

significant difference in satisfaction with Integration with other financial accounts and services of fintech among different age group.

4.5.9 Age group and Satisfaction with fintech services range and variety

H₀: There is no significant difference in Satisfaction with fintech services range and variety among different age group.

H₁: There is significant difference in Satisfaction with fintech services range and variety among different age group.

Table 37: ANOVA with Age group and Satisfaction with fintech services range and variety

ANOVA					
Age group - Satisfaction with fintech services range and variety					
	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	10.987	4	2.747	3.165	0.015
Within Groups	169.233	195	0.868		
Total	180.22	199			

Interpretation: In this case, the p-value 0.015 which is less than 0.05. Therefore, we reject the null hypothesis. There is enough evidence to conclude that there is significant difference in satisfaction with fintech services range and variety among different age group.

4.5.10 Age group and Overall satisfaction with using fintech services

H₀: There is no significant difference in overall satisfaction with using fintech services among different age group.

H₁: There is significant difference in overall satisfaction with using fintech services among different age group.

Table 38: Age group and Overall satisfaction with using fintech services

ANOVA					
Gender - Overall satisfaction with using fintech services					
	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	4.473	4	1.118	0.947	0.438
Within Groups	230.307	195	1.181		
Total	234.78	199			

Interpretation: In this case, the p-value 0.438 is greater than 0.05. Therefore, we fail to reject the null hypothesis. There is not enough evidence to conclude that there is significant difference in overall satisfaction with using fintech services among age groups.

4.5.11 Education and Likely to use fintech services by recommendation

H₀: There is no significant difference in using fintech services by recommendation among different education level.

H₁: There is a significant difference in using fintech services by recommendation among different education level.

Table 39: ANOVA with Education and Likely to use fintech services by recommendation

ANOVA					
Education level - Fintech service recommendation					
	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	12.976	4	3.244	2.705	0.032
Within Groups	233.819	195	1.199		
Total	246.795	199			

Interpretation: In this case, the p-value 0.032 which is less than 0.05. Therefore, we reject the null hypothesis. There is enough evidence to conclude that there is significant difference in using fintech services by recommendation among different education level.

4.5.12 Education and Trust in fintech services

H_0 : There is no significant difference in trust level that fintech companies to handle their financial data securely and responsibly among different age group.

H_1 : There is significant difference in trust level that fintech companies to handle their financial data securely and responsibly among different age group.

Table 40: ANOVA with Education and Trust in fintech services

ANOVA					
Education level - Trust in fintech security					
	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	39.755	4	9.939	9.375	0
Within Groups	206.725	195	1.06		
Total	246.48	199			

Interpretation: In this case, the p-value is 0.000 which is less than 0.05. Therefore, we reject the null hypothesis. There is enough evidence to conclude that there is significant difference in trust level that fintech companies to handle their financial data securely and responsibly among different education level.

4.5.13 Education and Improvement due to fintech adoption

H_0 : There is no significant difference in improvement in banking experience due to fintech adoption among different education level.

H_1 : There is significant difference in improvement in banking experience due to fintech adoption different education level.

Table 41: ANOVA Education and Improvement due to fintech adoption

ANOVA					
Education level - Improvement due to fintech adoption					
	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	10.748	4	2.687	2.048	0.089
Within Groups	255.847	195	1.312		
Total	266.595	199			

Interpretation: In this case, the p-value 0.089 is greater than 0.05. Therefore, we fail to reject the null hypothesis. There is not enough evidence to conclude that there is significant difference in improvement in banking experience due to fintech adoption among different education level.

4.5.14 Education and Speed and efficiency of transactions

H₀: There is no significant difference in satisfaction with speed and efficiency of fintech services among different education level.

H₁: There is significant difference in satisfaction with speed and efficiency of fintech services among different education level.

Table 42: ANOVA with Education and Speed and efficiency of transactions

ANOVA					
Education level - Speed and efficiency of transactions					
	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	5.578	4	1.395	0.775	0.543
Within Groups	350.902	195	1.799		
Total	356.48	199			

Interpretation: In this case, the p-value 0.543 is greater than 0.05. Therefore, we fail to reject the null hypothesis. There is not enough evidence to conclude that there is significant difference in satisfaction with speed and efficiency of fintech services among different education level.

4.5.15 Education and Transparency and clarity of fees and charges

H₀: There is no significant difference in satisfaction with transparency and clarity of fees and charges of fintech services among different education level.

H₁: There is significant difference in satisfaction with transparency and clarity of fees and charges of fintech services among different education level.

Table 43: ANOVA with Education and Transparency and clarity of fees and charges

ANOVA					
Education level - Transparency and clarity of fees and charges					
	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	9.012	4	2.253	1.609	0.173
Within Groups	272.988	195	1.4		
Total	282	199			

Interpretation: In this case, the p-value 0.173 is greater than 0.05. Therefore, we fail to reject the null hypothesis. There is not enough evidence to conclude that there is significant difference in satisfaction with transparency and clarity of fees and charges of fintech services among different age groups.

4.5.16 Education and Personalization and customization options

H₀: There is no significant difference in satisfaction with Personalization and customization options of fintech services among different education level.

H₁: There is significant difference in satisfaction with Personalization and customization options of fintech services among different education level.

Table 44: ANOVs with Age group and Personalization and customization options

ANOVA					
Education level - Personalization and customization options					
	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	11.563	4	2.891	2.317	0.059
Within Groups	243.312	195	1.248		
Total	254.875	199			

Interpretation: In this case, the p-value 0.059 is greater than 0.05. Therefore, we fail to reject the null hypothesis. There is not enough evidence to conclude that there is significant difference in satisfaction with Personalization and customization options of fintech services among different education level.

4.5.17 Educational and Educational resources and financial literacy tools

H₀: There is no significant difference in satisfaction with Educational resources and financial literacy tools of fintech services among different education level.

H₁: There is significant difference in satisfaction with Educational resources and financial literacy tools of fintech services among different education level.

Table 45: ANOVA with Educational level and Educational resources and financial literacy tools

ANOVA					
Education level - Educational resources and financial literacy tools					
	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	6.213	4	1.553	1.086	0.364
Within Groups	278.782	195	1.43		
Total	284.995	199			

Interpretation: In this case, the p-value 0.364 which is greater than 0.05. Therefore, we fail to reject the null hypothesis. There is no enough evidence to conclude that there is significant difference in satisfaction with educational resources and financial literacy tools of fintech services among different education level.

4.5.18 Education and Integration with other financial accounts and services

H₀: There is no significant difference in satisfaction with Integration with other financial accounts and services of fintech among different education level.

H₁: There is significant difference in satisfaction with Integration with other financial accounts and services of fintech among different education level.

Table 46: ANOVA with Education with Integration with other financial accounts and services

ANOVA					
Education level - Integration with other financial accounts and services					
	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	18.671	4	4.668	3.315	0.012
Within Groups	274.609	195	1.408		
Total	293.28	199			

Interpretation: In this case, the p-value 0.012 is less than 0.05. Therefore, we reject the null hypothesis. There is enough evidence to conclude that there is significant difference in satisfaction with Integration with other financial accounts and services of fintech among different education level.

4.5.19 Education and Satisfaction with fintech services range and variety

H₀: There is no significant difference in Satisfaction with fintech services range and variety among different education level.

H₁: There is significant difference in Satisfaction with fintech services range and variety among different education level.

Table 47:ANOVA with Education and Satisfaction with fintech services range and variety

ANOVA					
Education level - Satisfaction with fintech services range and variety					
	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	9.918	4	2.479	2.839	0.026
Within Groups	170.302	195	0.873		
Total	180.22	199			

Interpretation: In this case, the p-value 0.026 which is less than 0.05. Therefore, we reject the null hypothesis. There is enough evidence to conclude that there is significant difference in satisfaction with fintech services range and variety among different education level.

4.5.20 Education and Overall satisfaction with using fintech services

H₀: There is no significant difference in overall satisfaction with using fintech services among different education level.

H₁: There is significant difference in overall satisfaction with using fintech services among different education level.

Table 48: ANOVA with Education and Overall satisfaction with using fintech services

ANOVA					
Education level - Overall satisfaction with using fintech services					
	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	14.415	4	3.604	3.189	0.014
Within Groups	220.365	195	1.13		
Total	234.78	199			

Interpretation: In this case, the p-value 0.014 is greater than 0.05. Therefore, we reject the null hypothesis. There is enough evidence to conclude that there is significant difference in overall satisfaction with using fintech services among different education level.

Chapter 5- Findings and Conclusion

5.1 Findings

Adoption Rate Analysis

Age and Adoption: The analysis revealed that younger age groups, particularly those between 18-35 years, exhibited higher adoption rates of fintech services. This trend can be attributed to the greater comfort and familiarity with technology among younger demographics. In contrast, older age groups, especially those above 50, showed lower adoption rates due to potential technological barriers and a preference for traditional banking methods.

Education: The research indicated a positive correlation between higher education levels with increased fintech adoption. Individuals with higher education levels demonstrated greater access to and awareness of fintech services, leading to higher adoption rates. This finding suggests that socioeconomic factors play a significant role in fintech adoption.

Gender Differences: The analysis also revealed marginal differences in fintech adoption rates between genders. While males exhibited slightly higher adoption rates than females for certain fintech services such as digital payments, the overall adoption rates were relatively similar. This finding suggests that gender may have a nuanced influence on fintech adoption and warrants further investigation.

Fintech Accessibility Evaluation

The research findings highlighted several factors that contributed to the accessibility of fintech services. Ease of use, availability on mobile platforms, and personalized features were identified as key drivers of fintech accessibility. Fintech services that offered customization options and integrated assistive technologies were found to enhance accessibility.

Barriers to Accessibility: The analysis also identified barriers to fintech accessibility. Factors such as lack of digital and financial literacy, unreliable connectivity, and physical accessibility issues at bank branches were found to hinder the widespread adoption of fintech services. These barriers underscore the importance of addressing accessibility challenges to ensure equitable access to fintech solutions.

Customer Satisfaction Assessment

Key Drivers of Satisfaction: The research revealed that convenience, speed, 24/7 availability, and lower costs were the primary drivers of customer satisfaction with fintech services in the banking sector. Fintech solutions that offered seamless and efficient transaction experiences, coupled with lower costs, garnered higher levels of customer satisfaction.

Factors affecting satisfaction: Security concerns, lack of clarity over charges, and a limited range of services were identified as factors that affected customer satisfaction with existing fintech solutions. Addressing these concerns and enhancing the security and transparency of fintech services emerged as critical areas for improving customer satisfaction levels.

These findings provide valuable insights into the factors influencing the adoption, accessibility, and customer satisfaction of fintech services in the banking sector.

5.2 Conclusion

The report concludes that fintech adoption is high among younger age groups due to digital literacy and comfort with technology. However, barriers such as lack of awareness, trust concerns, and infrastructure limitations persist, particularly in rural areas and among older demographics. Convenience, accessibility, and cost savings are key motivators for fintech usage. Collaboration between fintechs and traditional banks holds potential, but addressing security concerns and knowledge gaps is crucial for maximizing fintech benefits, especially for rural communities and older demographics.

Annexure

Questionnaire

Dear Respondent,

I'm Keyur Pathar, studying in a B.B.A HONOURS programme from B.R.C.M College of Business Administration. I am conducting a research on "Factors affecting the use of fintech in banking."

Your response would be helpful in my research, assuring full confidentiality of your response. These would be used only for academic purpose.

Thank You !!!!

The word **"fintech"** is simply a combination of the words "financial" and "technology". It describes **the use of technology to deliver financial services and products to consumers.**

For example, Digital wallets, Mobile payments, peer to peer lending, etc.

1.) What is your name?

2.) What is your gender?

- ☐ Male
- ☐ Female

3.) What is your age group?

- ☐ 18-24
- ☐ 25-34
- ☐ 35-44
- ☐ 45-54
- ☐ 54+

4.) What is your highest level of education?

- ☐ No formal education
- ☐ Primary education

- Secondary education
- Undergraduate degree
- Postgraduate degree

5.) How familiar are you with the term "fintech"?

- I'm not familiar with it at all.
- I've heard it but I'm not sure what it means.
- I have a general understanding of what it means.
- I'm well-versed in fintech and its different applications.

6.) Have you ever used any mobile banking applications like Paytm, PhonePe, or Google Pay?

- Yes
- No

7). what are the factors encouraging you to use fintech in banking? (Select all that apply)

- ☐ Increased convenience and accessibility
- ☐ Lower fees and charges
- ☐ Personalized financial solutions and advice
- ☐ Innovative and user-friendly technology
- ☐ Improved security and data protection

8.) Would you be more likely to use a fintech service if it was recommended by a friend or family member?

- Yes, definitely
- Probably
- Maybe
- Probably not
- Definitely not

9.) I face following difficulties while using fintech applications or services? (Select all that apply)

- ☐ Complex user interface or lack of technical knowledge
- ☐ Concerns about data privacy and security

- ☐ Lack of trust in fintech companies or technology
- ☐ Limited availability of desired fintech services
- ☐ Difficulty accessing or using the services due to internet connectivity issues
- ☐ Not faced any difficulties

10.) On a scale of 1 to 5, how much do you agree with the following statement: "I trust fintech companies to handle my financial data securely and responsibly"

- ☐ 1 Strongly disagree
- ☐ 2
- ☐ 3
- ☐ 4
- ☐ 5 Strongly agree

11.) How often do you use internet banking or mobile banking apps?

- ☐ Daily
- ☐ Occasionally
- ☐ Rarely
- ☐ Never

12.) Would you be more likely to use fintech services if they were more user-friendly?

- ☐ Definitely yes
- ☐ Probably yes
- ☐ Neutral
- ☐ Probably not
- ☐ Definitely not

13.) How confident are you that your bank or other financial institutions are actively working to improve the accessibility and ease of use of their fintech services?

- ☐ Not at all confident
- ☐ Slightly confident
- ☐ Moderately confident
- ☐ Very confident
- ☐ Extremely confident

14.) Which of the following factors do you believe significantly impact the accessibility of using fintech in banking? (Select all that apply)

- ☐ Screen reader compatibility
- ☐ Keyboard navigation and shortcuts
- ☐ Adjustable font size and color contrast
- ☐ Availability of personalized accessibility settings
- ☐ Physical accessibility barriers at bank branches

15.) How important is it for banking apps to offer multiple language options to improve accessibility for diverse populations?

- ☐ Not important at all
- ☐ Somewhat important
- ☐ Moderately important
- ☐ Very important

16.) To what extent do you think mobile technology and smartphone penetration enhance the accessibility and use of fintech banking services?

- ☐ To a very great extent
- ☐ To a moderate extent
- ☐ To a small extent
- ☐ Not at all

17.) On a scale of 1 to 5, how much do you agree with the following statement: "Fintech applications and services make banking more convenient and efficient than traditional methods."

- ☐ 1 Strongly disagree
- ☐ 2
- ☐ 3
- ☐ 4
- ☐ 5 Strongly agree

18.) Overall, how much has the adoption of fintech improved your overall banking experience?

- ☐ A significant improvement
- ☐ A slight improvement
- ☐ No noticeable change
- ☐ A slight decline
- ☐ A significant decline

19.) How likely are you to recommend using fintech applications or services to your friends and family?*

- ☐ Very likely
- ☐ Somewhat likely
- ☐ Neutral
- ☐ Somewhat unlikely
- ☐ Very unlikely

20.) Compared to traditional banking, how transparent and communicative do you find fintech banking, when dealing with customer queries and issues?

- ☐ Much more transparent and communicative
- ☐ Slightly more transparent and communicative
- ☐ About the same
- ☐ Slightly less transparent and communicative
- ☐ Much less transparent and communicative

21.) Please rate your level of satisfaction with the following aspects of using fintech in banking:

Very Dissatisfied Dissatisfied Neutral Satisfied Very

Satisfied

1.) Speed and efficiency ☐ ☐ ☐ ☐ ☐

and efficiency

2.) Transparency and clarity ☐ ☐ ☐ ☐ ☐

of fees and charges

3.) Personalization and
